

Access and Elevate Your Security on SAP

Challenge

Strengthening security posture, simplifying compliance and automating security tasks

Organizations in highly regulated industries are moving their workloads to the Cloud as part of their IT modernization plans. These workloads involve mission-critical applications and sensitive data and the added security and compliance scrutiny to keep them protected can be challenging.

The Lemongrass Solution

Cloud services supporting sensitive enterprise data and applications in regulated environments

Lemongrass regularly achieves third-party validation for thousands of global compliance requirements which we continuously monitor to help your organization meet security and compliance standards across many industry sectors. Most recently, Lemongrass acquired SOC1 TYPE2 and SOC2 TYPE1 certifications.

Lemongrass is also aligned to the [NIST Cyber Security Framework \(CSF\)](#) and [CIS Benchmarks](#). Using NIST and CIS to baseline the Lemongrass Security Framework, we are able to extend the baselines to provide a flexible framework to meet the ever-changing requirements of our customers.

Benefits

Secure Enough for Regulated Enterprise Workloads

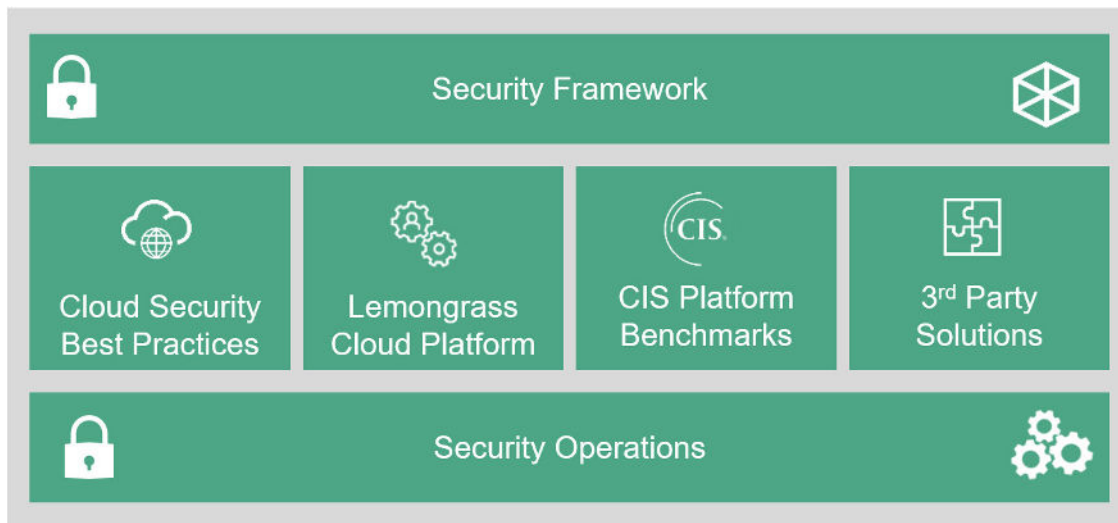

All customers benefit from a commercial Cloud platform whose service offerings and associated supply chain have been vetted and accepted as secure enough for top-secret workloads. Lemongrass has worked with numerous customers in regulated environments, including ones in the Government, Life Sciences and Finance sectors. This allows us to build on our extensive experience and expertise so we can meet the many regulatory and compliance requirements for our customers' workloads running on public Cloud. We are also listed as a supplier on the [GOV.UK G-Cloud 12 Digital Marketplace](#).

Gartner predicts that in 2021, Cloud workloads will experience **60% fewer security incidents** than those in traditional data centers and through 2022, at least **95% of security failures** in the Cloud will be caused by customers.

Lemongrass Security Operations

Lemongrass primarily uses native Cloud technologies and services as the foundation for our Security Framework. We deploy an IAM Framework that incorporates centralized security management with support for multiple autonomous independent Cloud accounts. The Lemongrass Cloud Platform can also help mitigate risk of a malicious user situation or a security breach event by automating a response thereby reacting much faster and remedying accordingly.

Lemongrass Platform Security Framework

Security by Design

Lemongrass embraces the Security by Design method in all aspects of our design, migration and operational services. To help protect your organization, we ensure that Cloud security best practices are integrated in each Account Design pattern to protect data and assets in the Cloud.

Our approach seeks to make systems as free of vulnerabilities and impervious to attack as possible through such measures as continuous testing, authentication safeguards and adherence to best programming practices.
